

Fuelsafe - Grenade Resistant Dual Fuel Can Holder

Fuelsafe

Borne out of a customer request, the need for such equipment reflects the hazardous nature of both peacekeeping and relief operations. Many organisations need to transport their own fuel, whether within a vehicle or on a roof rack.

Hand grenades are cheap, readily available and easy to use weapons. The combined blast and hot fragmentation effects pose a direct risk to fuel under transportation. The consequential effects of your fuel exploding can make a bad situation very much worse.

This equipment is designed to mitigate this danger whilst providing practical security measures against theft and damage.

Key Features:

Fibre reinforced composite construction with overlaps on the join line between the base and lid to avoid a ballistic gap.

Can be securely mounted to a roof rack. Can only be removed by undoing the bolts from the inside.

Internal partition to hold single or double loads securely.

Sturdy padlock hasp and robust hidden hinges.

Colour can be specified by customer. Standard colours are grey/green/white/black/brown

Tested against the British L2A2 Grenade - 170g of high explosives with fragmentation.

Weight: 15kg.

Blast Testing Fuelsafe Units with L2A2 Hand Grenade
